

Get paid for the word you spread.

Proof-of-advocacy rewards on Avalanche. Real behaviour, attested by the business, paid from a budget written once on-chain — that can never be raised.

ubu — from *ubuntu*: a person is a person through other people · **tangaza** — Swahili: *to announce*

THE PROBLEM

Word of mouth builds Kenyan businesses. Nobody can pay for it safely.

- **The advocates get nothing.** The customer who brings five friends gets a handshake.
- **Loyalty points die of success.** Unlimited emission → unbudgeted liability → program cancelled, trust burned.
- **Influencer spend is unverifiable.** You pay for reach, not for people through the door.

One contract fixes both sides: advocacy becomes attested and payable, and the budget becomes physically impossible to overrun.

NAME THE BEHAVIOUR · NAME THE METRIC

Bring a friend. Post about us. Measured to the shilling.

THE BEHAVIOUR

A member brings a person through the door, or posts about the business — and their own wallet records it on-chain.

THE METRIC — LIVE TODAY

KES 15

per **verified** advocacy action
= committed budget ÷ approved activities, computed from chain state

REPEAT BEHAVIOUR

Streaks (consecutive active days, on-chain) and **levels** — Regular → Champion → Founder's Circle — set by each business.

The loop

- 1 **Advocate's wallet writes the activity on-chain** — `submitActivity()`, gas sponsored, `msg.sender` is the identity
- 2 **Business approves with its wallet** — the contract rejects every other signer (`NotApprover`)
- 3 **Every 20 approved activities mints a KES 500 credit** — engagement weights set by the business price each act
- 4 **Burn-on-redeem** — airtime, data or voucher; every redemption shrinks the business's liability

Composed from the cohort's building blocks — capped token + streaks + tiers — in one contract, **45 tests passing**.

LIVE — EVERY STEP A REAL FUJI TRANSACTION

The demo **is** the product

PHONE — THE ADVOCATE

Opens the campaign → submits proof → **Core prompts, she signs** → “Recorded on Avalanche” with her own tx hash on screen.

LAPTOP — THE BUSINESS

The queue shows it, with the “*submitted on-chain by their wallet*” link → **Approve, Core prompts, they sign** → mined; count & streak move on-chain.

“No placeholder data. That was her wallet writing to Fuji — and the contract just refused every other signer on this chain.”

CAN IT SURVIVE SUCCESS?

The chain enforces the CFO

1 · BUDGET-BACKED

No org exists without committing `emissionCapKES`.
Every credit is KES 500 of airtime, data or voucher.

2 · CAPPED EMISSION

Written once. **No function can raise it** — CI pins the contract's full function list; verified source on Snowtrace.

3 · SINKS THAT WORK

Burn-on-redeem shrinks outstanding liability — and redemptions **never reopen minting headroom**.

4 · VALUE FROM THE PRODUCT

Earned by attested behaviour, spent on real rewards. Non-transferable: no market, no speculation loop.

At the cap: activities still record, `BudgetExhausted` fires, **nothing reverts** — worst-case cost is known on day one.

DEPLOYED, NOT DEMOED

A non-crypto user never notices the chain

- **Social login is the wallet.** Google, X or email — no seed phrase, ever.
- **Gas is sponsored.** Advocates never hold AVAX and never see the word.
- **No crypto vocabulary** on the customer surface — the account is just “you”.
- **Or bring your own wallet** — Core, Avalanche’s own, works out of the box.
- **The chain shows up only as trust:** every reward carries a receipt anyone can check.

| *“Every journey we move together, we grow together.”*

THE ASK

**One behaviour. One mechanic.
Live on Avalanche — and an economy
that survives its own success.**
